

enhanced ways to listen to sounds			ways to characterize and organize the sound			
accessibility	playback	editing		organization (grouping/sorting)	saving	searching
standard start + stop sounds	pause/resume playback (very hard because sound takes command line)	trim beginning/end of a sound		basic metadata fields	Create new file after editing	searching/making temporary directory for results
	volume control	Extract and save subsnippets		making playlists in separate directories	make a save tag when playing more than just a single unedited sound	option to make more permanent directories (user defined directories?)
set start/stop sounds?	set default sound folder (so you don't have to put name before sounds)	Delete subsnippet from audio file and append		User Created Tags	Export sound file in a select audio format	
toggle start.stop sounds (if you want 'em or not)		Create new sounds from subsnippets of other sounds				new search tag, probs needs to know metadata tag, metadata tag value, and name to call the directory it moves to
	settings tag? with subtags to set volume (with example sound) and set default folder)	Merging audio files into new file		a way to list all of the metadata associated with one file. (--settings <file_name>)	optional save tag when playing multiple sounds/editing	
		adding audio filters to sounds		something like --settings <file_name> <tag_name> <tag_value>	Prompt to name new file	
				Enter tag name	Select directory for new file	
		new edit command, with one or multiple sounds				
		edit some sounds in a play command
